Figure 27

# Effect of Applying Correctness Score Transform to HIV Data

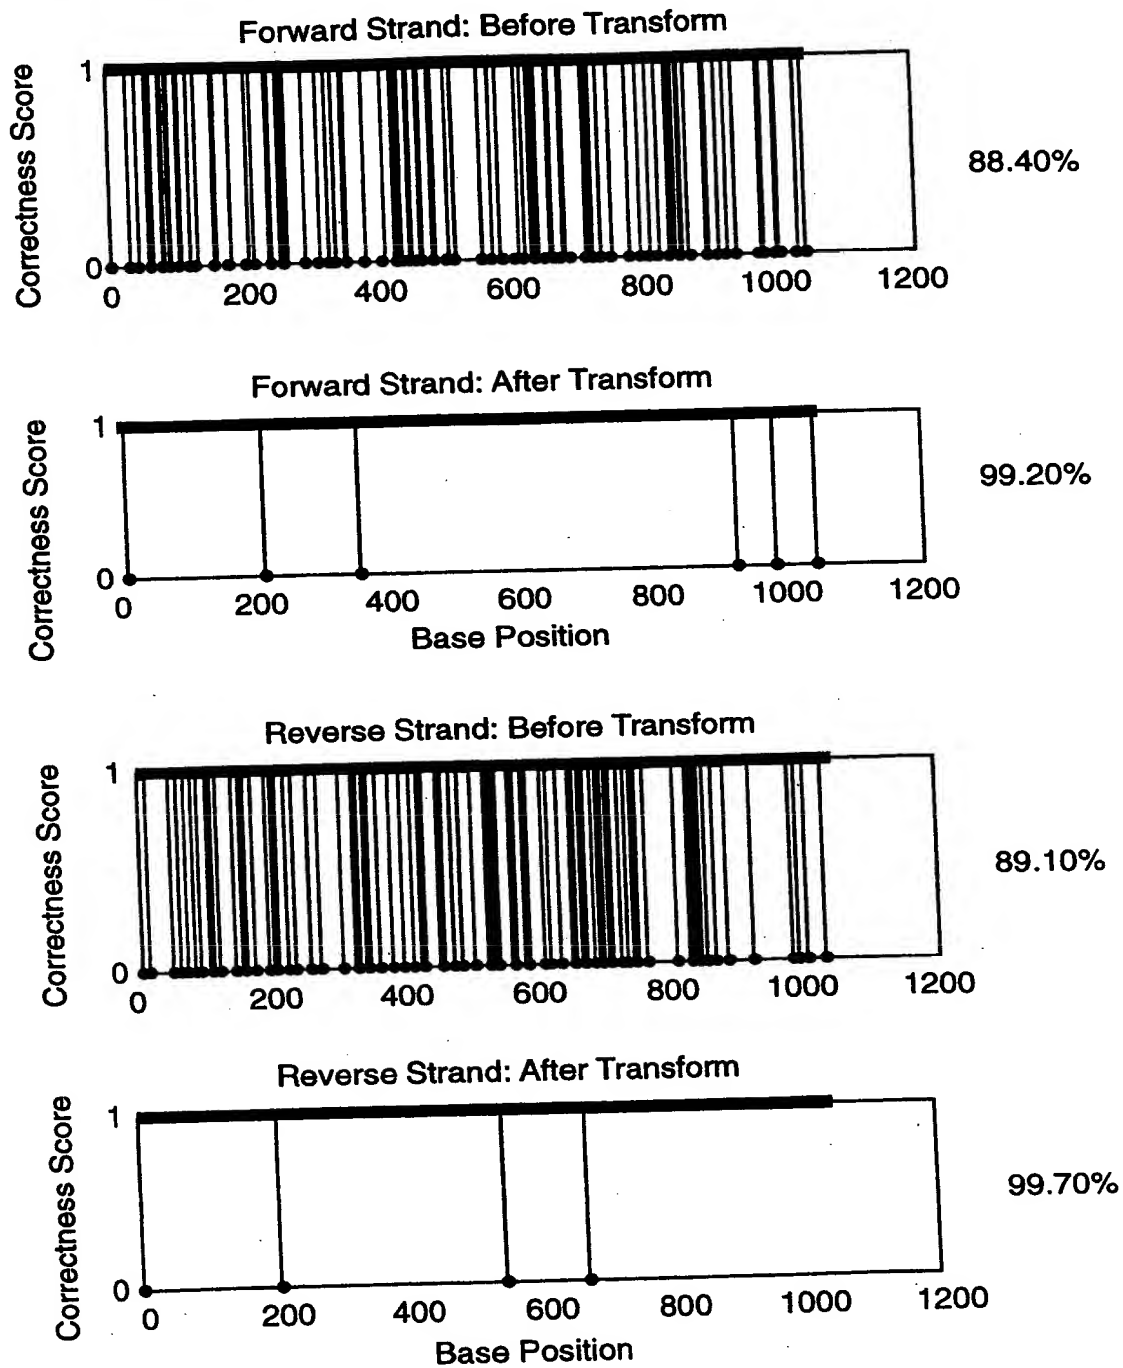

Figure 28

# Mutation Detection by Intensity Comparisons

## Algorithms:

$$I_{\text{normalized}} = I_{\text{probe}} / (\sum I_{\text{NN}})$$

$$I_{\text{difference}} = \frac{(I_{\text{normalized, variant}} - I_{\text{normalized, control}})}{(I_{\text{normalized, variant}} + I_{\text{normalized, control}})}$$

- Locally normalized intensities track well
- Local normalization is sensitive to mutations

Figure 29

## Bubble Formation Detection of Mutation in HIV Genome

## Normalized Intensity Comparison:

## Normalized Difference:

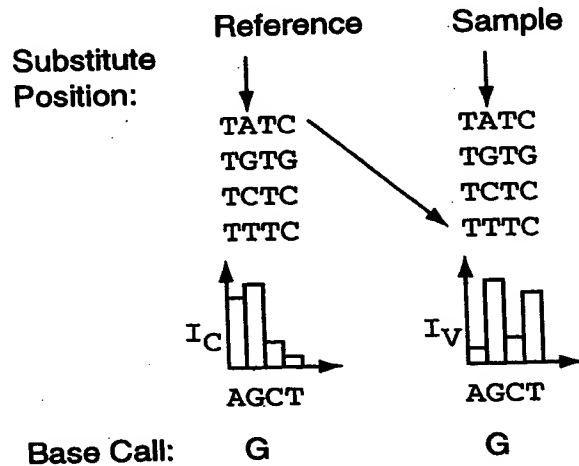

Figure 30

## Induced Difference Nearest Neighbor Probe Scoring:

Induced Difference:  $D_A = (I_{V,A} - I_{C,A}) / I_{C,A}$

- Average induced differences over all tilings and over both forward and reverse strands.

- Probe with A - "down-regulated"
- Probe with T - "up-regulated"
- A  $\rightarrow$  T mutation

- Total Induced Difference  $> +$  Threshold: Mutation Exists
- Total Induced Difference  $< -$  Threshold: Mutation Exists
- Two criteria for mutations: Induced Difference Scores; Bubble Formation
